## 4. Chapter: Clin Sci I - GI Twedt quiz

### 1. Clin Sci I - GI Twedt quiz Questions

#### 4.1.1. 10 yr old dog presents with 2 months history of a "horse" bark , di...

Author: Brooke Delaney

10 yr old dog presents with 2 months history of a "horse" bark , difficulty swallowing , and gagging . The dog also becomes weak when exercising. This dog has good appetite, diet, no weight loss, and up to date on vaccinations. No significant findings upon PE except loud respiratory sounds over pharynx. What is the major problem for this case?

Please choose only one answer:

- Regurgitation
- Pharyngitis
- Possible Rabies
- Dysphagia
- "horse bark" sound

Author: Brooke Delaney

10 yr old dog presents with 2 monts history of a "horse" bark , difficulty swallowing , and gagging . The dog also becomes weak when exercising. This dog has good appetite, diet, no weight loss, and up to date on vaccinations. No significant findings upon PE except loud respiratory sounds over pharynx. . Besides observing the dog eat and drink , you decide to run a myasthenia gravis antibody titer assay, is this considered a necessary diagnostic plan for this dog?

Please choose only one answer:

- Yes, neuromuscular disease causing dysphagia should always be considered.
- No, this dog clearly does not have a neuromuscular disease since it is not experiencing regurgitation.

Author: Brooke Delaney

14 week old dog presents with vomiting where food "plops out" in solid form 2-15 min after eating . Dog is is not retching and is always hungry. There is no weight loss and the dog seems to be healthy in other aspects. This dog is also up to date on vaccines. PE is normal including a normal gag reflex . A barium study radiograph is performed revealing dilation of the cervical and proximal thoracic esophagus with a narrowing in mid thorax . There is a normal caudal esophagus diameter. What is the most likely differential for this dog?

Please choose only one answer:

- Esophagitis (most likely caused by caustic substance)
- Myasthenia gravis
- Congenital vascular ring anomaly
- Esophageal foreign body
- Acquired megaesophagus

#### 4.1.11. 8 yr old mixed breed dog presents with unproductive coughing, vomit...

Author: Brooke Delaney

8 yr old mixed breed dog presents with unproductive coughing, vomiting undigested food, and gagging. The dog is not retching. The vomiting occurs shortly after eating or a few hours later. The cough often precedes the vomiting. On PE, the dog appears weak, depressed, and nauseated. The only other abnormal finding on PE are wheezes over ventral thorax on left and right side. The dog is current on vaccinations. After taking radiographs, you are able to diagnose this patient with aspiration pneumonia secondary to megaesophagus. What is the best treatment ?

Please choose only one answer:

- Place dog on Metaclopramide for gastric motility and Ranitine for esophagitis along with broad spectrum antibiotics for 2-3 weeks for pneumonia
- Treat pneumonia with broad spectrum antibiotics and feed animal using Bailey chair
- Need to perform an esophageal laryngoscopy for a diagnosis
- Surgical myotomy
- Give steroids to treat for possible hypoadrenocorticism and the aspiration pneumonia should resolve itself

#### 4.1.12. Canine dysautonomia is a rare condition in dogs associated with deg...

Author: Brooke Delaney

Canine dysautonomia is a rare condition in dogs associated with degeneration of autonomic nervous system. What is the best way to diagnose this disease?

Please choose only one answer:

- Run a myasthenia gravis antibody titer test
- Fecal exam and urinalysis since these dogs have diarrhea and dysuria
- Barium contrast study radiograph
- Schmirmer tear test and pharmacologic testing of the pupils (i.e. provocative ocular test using Pilocarpine) to determine mydriasis
- Run a thyroid panel

#### 4.1.13. 8 month old female puppy presents with acute vomiting (12 hours) af...

Author: Brooke Delaney

8 month old female puppy presents with acute vomiting (12 hours) after getting into the garbage the previous day. The vomit initially contained food, pieces of plastic, steak scraps and other assorted bits of garbage. Dog does not have diarrhea and is bright and alert. She is current on her vaccinations and was dewormed. The PE exam did not give any significant findings other than a slight dehydration based on skin turgor. What is the next step?

Please choose only one answer:

- diagnose this as gastric enteritis. NPO then start ice cubes and small amounts of water. If vomiting stops after 12 -14 hrs can start bland diet.
- do a barium contrast study radiograph to find out if there is any garbage left
- run a urinalysis and fecal exam
- run a Chem panel and CBC
- run all of the diagnostic tests above and convince your client to do an MRI and CT scan because the most important thing in veterinary medicine is the animals health not your clients bill

#### 4.1.30. 2 yr old male German Shepherd presents chronic diarrhea last 8 mont...

Author: Brooke Delaney

2 yr old male German Shepherd presents chronic diarrhea last 8 months with yellow "cow pie" consistency . The dog is losing weight but the appetite remains good. There is no vomit or cough and the dog is up to date on vaccinations. PE does not have any significant abnormal findings other than noting the dog is thin. Fecal results in a positive for sudan stain. Other diagnostics include a Low B12 and high Folate test result. What is your next step?

Please choose only one answer:

- Obtain a biopsy of colon because you suspect chronic cholitis
- Obtain a culture of feces for small intestine bacterial overgrowth
- Try a diet trials since you suspect a food allergy
- Perform a TLI test since you suspect EPI (exocrine pancreatic insufficiency)
- Since you are fairly confident this dog has colon cancer ; euthanasia is the best option
